Sequence 3, Application US/09953349

Patent No. US20020099014A1

GENERAL INFORMATION:

APPLICANT: Brennan. Wiles

APPLICANT: Hochgeschwender, Ute

TITLE OF INVENTION: Method for Treatment of Insulin Resistance in Obesity and Diabetes

TITLE OF INVENTION: Method for Treatment of CURRENT APPLICATION NUMBER: US/09/953,349

CURRENT FILING DATE: 2001-09-13

FRIOR APPLICATION NUMBER: 60/232,292

PRIOR APPLICATION NUMBER: 60/232,292

PRIOR PILING DATE: 2000-09-13

NUMBER OF SEQ ID NOS: 8

SOFTWARE: Patentin Version 3.0
                                                                                                                                                                                                                                                                                                                                                                             Publication No. US20030219825A1

-1 SUBCELLULAR LOCATION: Secreted.
-1 TISSUE SPECIFICITY: Expensed by the venom duct.
-1- PTM: The cis isomer is the most abundant and is thus thought to be the functionally relevant conformer.
-1- MASS SPECTROMETRY: MW-1088-6; METHOD=MALDI.
-1- SIMILARITY: Belongs to the contryphan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Biochem. Biophys. Res. Commun. 160:850-856(1989).

-!- FUNCTION: Muscle inhibiting agent. Involved in the neural control of the visceral muscles of the heart, accessory glands and oviduct. May be involved in the regulation of saliva secretion.

-!- TISSUB SPRCIFICITY: Found in axons of the male accessory glands, the salivary glands, the heart, and the oviduct.

-!- SIMILARITY: Belongs to the FARP (FMRPamide related peptide)
family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nakamura S., Takenaka O., Takahashi K.,
"Fibrinopeptides A and B of baboons (Papio anubis, Papio hamadryas,
and Theropithecus gelada): their amino acid sequences and
evolutionary rates and a molecular phylogeny for the baboons.";
J. Biochem. 94:1973-1978 (1983).
-!- FUNCTION: Fibrinogen has a double function: yielding monomers that
polymerize into fibrin and acting as a cofactor in platelet
                                                                                                                                                                                                                                                                                                     Cintra A.C.O., Viella C.A., Giglio J.R.;

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227 (1990).

-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

(ALPHA, BETA AND GAMMA), LINKED TO EACH OTHER BY DISULFIDE BONDS.

-!- PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.

Hum. Retroviruses 4:165-173(1988).
-!- FUNCTION: NEF has GTPase, GTP-binding and autophosphorylating
-!- activities. It seems to down-regulate the CD4(T4) antigen.
-!- MISCELLANEOUS: THE Z-84 ISOLATE NAS TAKEN FROM A 54 YEAR-OLD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-OCT-1989 (Rel. 12, Created)

"WWamide-1, -2 and -3: novel neuromodulatory peptides isolated from
ganglia of the African giant snail, Achatina fulica.";
FEBS Lett. 323:104-108(1993).
-!- FUNCTION: Exhibits modulatory effects on the peripheral nervous
system. Inhibits activity on a central neuron.

Thimary structures of hypertrehalosaemic neuropeptides isolated from the corpora cardiaca of the cockroaches Leucophaea maderae,

The corpora cardiaca of the cockroaches Leucophaea maderae,

The corpora cardiaca of the cockroaches Leucophaea maderae,

The mad of the stick insect Extatosoma tiaratum assigned by tandem fast atom bombardement mass spectrometry.";

Biol. Chem. Hoppe-Seyler 371:345-354 (1990).

L. FUNCTION: Hypertrehalosaemic factors are neuropeptides that clevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

C. L. SUNILARITY: Belongs to the AKH / HRTH / RPCH family.

Gaede G., Rinehart K.L. of hypertrehalosaemic neuropeptides isolated from the corpora cardiaca of the cockroaches Leucophaea maderae,

Gromphadorhina portentosa. Blattella germanica and Blatta orientalis

T and of the stick insect Extatosoma tiaratum assigned by tandem fast

atom bombardment mass spectrometry.";

Biol. Chem. Hoppe-Seyler 371:345-354(1990).

L Biol. Chem. Hoppe-Seyler 371:345-354(1990).

C -1- FUNCTION: Hypertrehalosaemic factors are neuropeptides that
elevate the level of trehalose in the hemolymph (trehalose is the
major carbohydrate in the hemolymph of insects).

C -1- SUMILARITY: Belongs to the AKH / HRTH / RPCH family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Proc. Natl. Acad. Sci. U.S.A. 89:2326-2330(1992).

-!- FUNCTION: Able to induce fluid secretion from the isolated salivary gland of Calliphora.

-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide) family.
                                                                                                                                                  33.3%; Score 12; DB 1; Length 9; 40.0%; Pred. No. 1.4e+05; tive 2; Mismatches 1; Indels

Proc. Natl. Acad. Sci. U.S.A. 89:2326-2330(1992).
-!- FUNCTION: Able to induce fluid secretion from the isolated salivary gland of Calliphora.
-!- SIMILARITY: Belongs to the FARP (FWRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of brackytinin by inhibiting the kinases that inactivate it. It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NCBI TaxID=8723;

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990).

-I- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-FEB-1994 (Rel. 28, Last sequence update)

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

poptides from Bothrops insularis snake venom.";

-i. Punction. This peptide both inhibits the activity of the angictensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it. It acts as an indirect hypotensive agent.

T.T.	Modifying and attaching therapeutic peptides to albumin prevents newridase degradation, useful for increasing length of in vivo activity.
X	
PS	Disclosure; Page 201; 733pp; English.
ន្តម	The present invention describes a modified therapeutic peptide (I)
ပ္ပ	comprising a therapeutically active amino acid region (III) and a
ខ្លួន	reactive group (II) (e.g. succinimidy1 and maleimido groups, areacmed to
ខ	bonds with amino/hydroxyl/thiol groups on blood components to form a
ဗ	peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
ខ្ល	(I) are useful for modifying therapeutic peptides e.g. hormones, growin
មួម	۹.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (III) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifyling therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiciogical processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New linear and cyclic alpha-melanotropin analogues - having increased potency and duration of action, used to stimulate melanocytes to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The analogues are more potent and/or last longer than alpha-MSH and/or are more resistant to degredation by blood serum enzymes. They may be useful than alpha-MSH in diagnosis, therapy and research into hypopigmentation dysfunctions etc. (Updated on 25-MAR-2003 to correct PI
